

# ESD Wrist Strap Receptacle

WS-4421 - WS-4429 - WS-4428

The Brass Jack wrist strap receptacle is machined from a bar of solid brass. It is round with a 1" diameter and 7/8" in length. It has four machined holes to receive a banana plugs – two can be used at the same time. It is designed to insure constant personal protection by being wired directly to Common Point Ground - WS-375 or WS-400. The 360 degree rotation gives freedom of movement and comfort at the ESD Workstation even when two personnel are connected. If personnel moves away from the station without disconnecting, there will be a smooth release from either direction with a breakaway force of 3 to 8 pounds.

The WS-4421 is designed to be installed on the underside of the ESD laminate table top.

The WS-4429 is designed to be installed in the metal bench frame.

The WS-4428 is designed to be installed in the metal bench frame when isolation from the frame is required.
